

Natural Pollination in Glasshouses, the Amazing Bumblebee!

Greenhouse (glasshouse) produce growers are finding that the demand for high-quality fruits, vegetables, and herbs year-round is requiring they harvest more to keep up.

Enter natural pollination, the process of using bees to pollinate fruits and vegetables. Using bumblebees to pollinate plants inside the greenhouse is one way to improve crop quality, increase yield, and reduce labour.

Introducing hives into a greenhouse can also help growers maintain an environmentally friendly space

One bee can pollinate up to 10,000 flowers a day

Over 3300 bumblebees pollinate the flowers

170 hives can be used in large scale glasshouses
